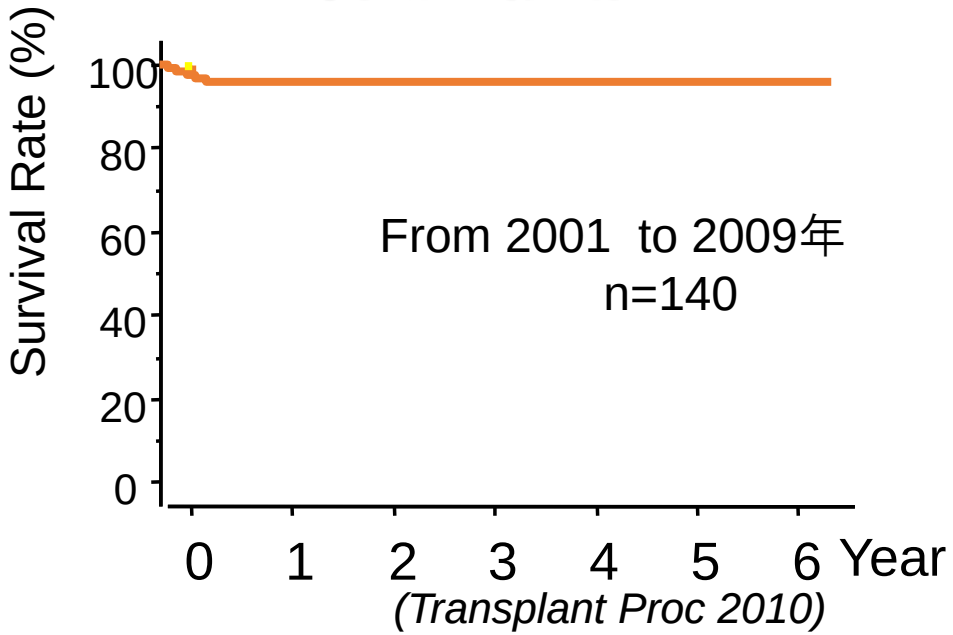
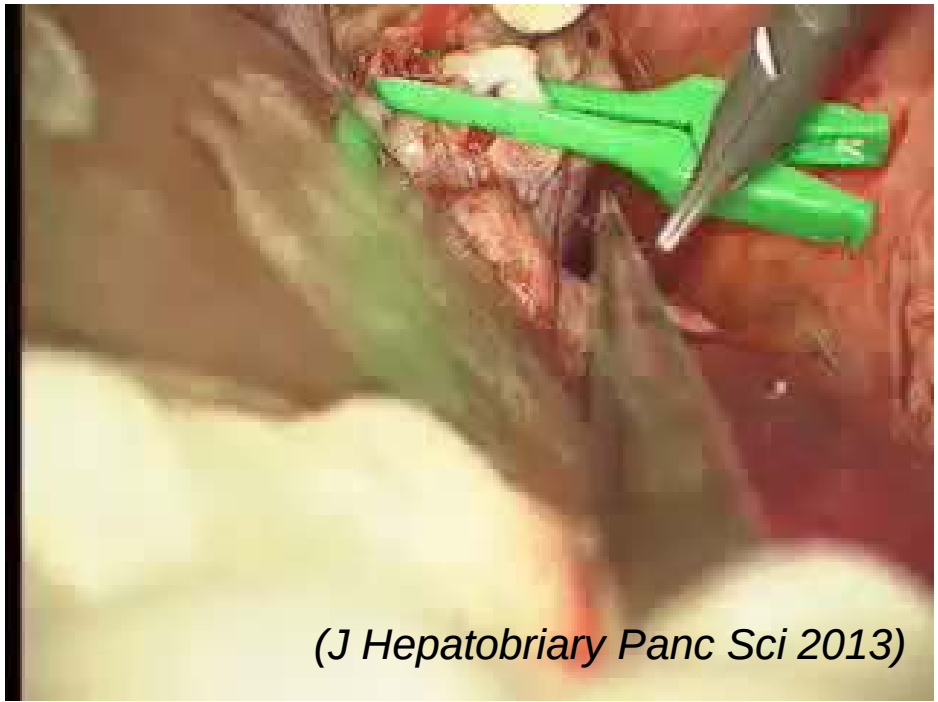
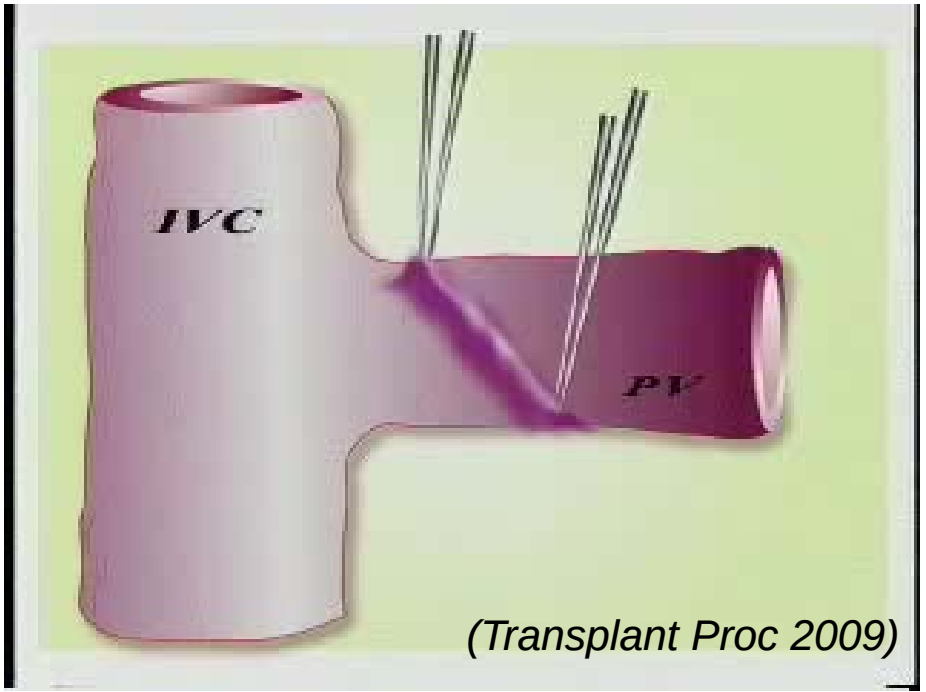
自治医科大学に於ける生体肝移植







イスタンブール宣言

(Istanbul, 30th April – 3rd May 2008)

1．Organ trafficking（臓器取引）、Transplant tourism（移植ツーリズム）、Transplant commercialism（移植商業主義）等の内容を明確して、人道的、社会的、国際的に問題があるものに対し世界的に反対すること。

2．死体（脳死、心停止）ドナーを自国で増やし、自国での臓器移植を増やすよう呼びかけること。そのために国際的協力をすること。

3．生体ドナーは、ドナー保護を最優先し、選定や移植に関わる総合的な保障等の制度を国家的に取り組むよう呼びかけること。

動物を利用したヒト臓器作成研究の現状

動物の利用形態			研究の現状
①動物性集合胚を用いて動物体内でヒト臓器を作製	小動物による実証研究（膵臓、腎臓）	⇨	臓器欠損ブタの作製（膵臓）
②ヒト幹細胞を動物体内に移植してヒト臓器を作製	小動物による実証研究（肝臓）	⇨	免疫不全ブタの作製
③動物の臓器原器にヒト幹細胞を注入してヒト臓器を作製	小動物による実証研究（腎臓）	⇨	ブタの臓器原器をラット、アカゲザルに移植（膵臓）
④動物臓器の骨格部分（スキャフォールド）を足場にしてヒト幹細胞からヒト臓器を作製	小動物による実証研究（心臓、腎臓、肝臓、肺）	⇨	ブタ臓器を使用してヒト臓器のサイズの足場を作製（肝臓）

Stem the tide

Japan has introduced an unproven system to make patients pay for clinical trials.

Japan has been working feverishly to stay at the cutting edge of research and clinical applications in regenerative medicine. It has invested billions of yen in induced pluripotent stem (iPS) cells — made by r

of millions of dollars. But it is not clear whether the acceleration will benefit patients or help Japan's overburdened national health system.

One of the approved treatments, HeartSheet, is made of skeletal-muscle stem cells that are taken from a patient's thigh and grown in the lab. The sheet, made by the company Terumo, is then applied to the hearts of people who have severe cardiac failure. Japan's health ministry gave “conditional approval” for clinical use of the treatment after the company carried out a phase II trial, which hinted at its safety and efficacy in seven patients (Y. Sawa *et al. Circ. J.* **79**, 991–999; 2015).

The company can market and sell the treatment. The approval comes with the condition that, within 5 years, Terumo must provide

ay, and pay dearly: the HeartSheet treat-
ion (US$122,000). Last month, the health
ocedures covered by national health insur-
patients still pay 10–30% of the cost for a drug that is not known to be effective. As they do so, they basically subsidize the company's clinical trial.

Japan has turned the drug-discovery model on its head. Usually, the investment — and thus the risk — is borne by drug companies, because they stand to gain in the long run. Now the risk is being outsourced. By the time it is clear whether a treatment works or not, the companies will have already made revenue from it.

The government argues that its system will encourage firms to bring to market regenerative-medicine treatments that might work. They will, at least, work well enough to make it past small initial trials. Many drugs do that, and then most of them fail at phase III.

“Japan could find itself flooded with unsuccessful treatments.”

Biotech companies in other countries are keen on the idea and have pushed their own regulatory bodies to follow Japan's lead. This is a bad move. Regulatory agencies around the world should resist pressure to create such fast-track systems, at least until Japan has proved that its system works. That will take time. The country will have to demonstrate that its health-care system can withstand the costs of the new regenerative-medicine treatments, and that patients do not feel cheated. What happens when, inevitably, one of the fast-track drugs turns out to be ineffective? Company officials and government representatives say that patients will not be reimbursed, even though some might have paid up to ¥4.5 million (the rest covered by health insurance) for an ineffective treatment.

Japan's drug authority must guarantee that the post-commercialization evaluation of the drugs will be as rigorous as it says. It will not be easy to rein in a drug that has already been approved, whether that approval is conditional or not. If lax evaluation means that ineffective drugs are not revealed, or are not taken out of circulation, Japan could find itself flooded with unsuccessful treatments. And that would not be good for patients, the government or the biotech companies that want to see their truly effective medicines noted as such. ■
